SAKURA
FILTERS AUSTRALIA

SAKURA FILTERS AUSTRALIA WARRANTY

Sakura Filters Australia warrants all Sakura products to be free of manufacturer's defects in materials, workmanship or design. Sakura Filters meet the highest JIS/SAE International Technical standards. Sakura Filters should be installed to manufacturer's specifications, used and changed in accordance with vehicle or equipment manufacturer's recommendations.

New vehicle/equipment warranties remain in effect when Sakura Filters are installed in accordance to the engine manufacturer's advice. At Sakura Filters Australia's manufacturing plant, all filters are manufactured to the highest Japanese JIS standards. At the same time our manufacturer has certification in the international quality assurance standard TUV SUD ISO/TS 16949:2009.

In the event of an engine or equipment failure directly caused by a defective Sakura product, Sakura Filters Australia will assist with the manufacturer to restore the engine or equipment to its condition before the incident. It is essential that the distributor of the product is notified immediately following a detected anomaly to obtain a claim form that should be completed and returned - with all information requested to be passed to Sakura Filters Australia for evaluation and start of the claim process. The filter, engine or equipment in question must be available for inspection for any repairs to be authorised.

Sakura Filters Australia is not liable for any other consequential losses or expenses incurred by such defect, or third party claim.

Sakura products must not be tampered with or tested without Sakura Filters Australia's authorisation before an inspection is concluded to determine the cause of failure. If this was to occur, the warranty will be void. Sakura Products that have been incorrectly installed, tampered with, or used in a modified engine or equipment, as well as misuse, negligence, accident, improperly maintained, or used for racing purposes will not be covered under this warranty.

Technical Information

Spin-On Filter

STEEL TENSION SPRING

Manufactured using a heat treatment process in order to maintain/support the element and prevent bypass

HEAVY DUTY END CAP SEALS

Made to withstand intra-plastisol leakage

HIGH PERFORMANCE MEDIA

Longer service life, less restriction

THICKER BODY

Greater structural integrity

SPRIAL PERFORATED TUBE

Improved strength and flow rate

HEAVY DUTY BASE PLATE

Superior structural support for maximum strength

Element Filter

GASKET SEAL

Designed with air spring within the core to provide better sealing and eliminate air leaks

FILTRATION MEDIA

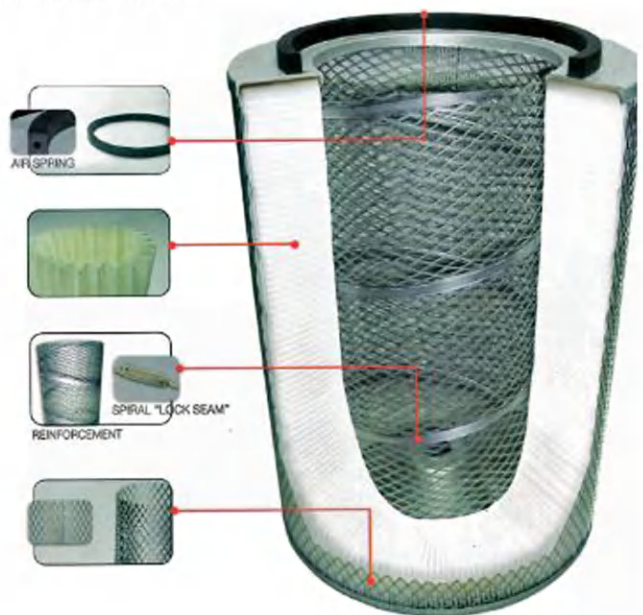

Media choice and pleating design to provide optimum performance and reduce differential pressure

INNER TUBE

Expanded metal with integrated "lock seam" provide better structural integrity when compared to conventional designs

OUTER TUBE

Straight clamping joint secures the edge of the media to eliminate premature wear and tear

Technical Information

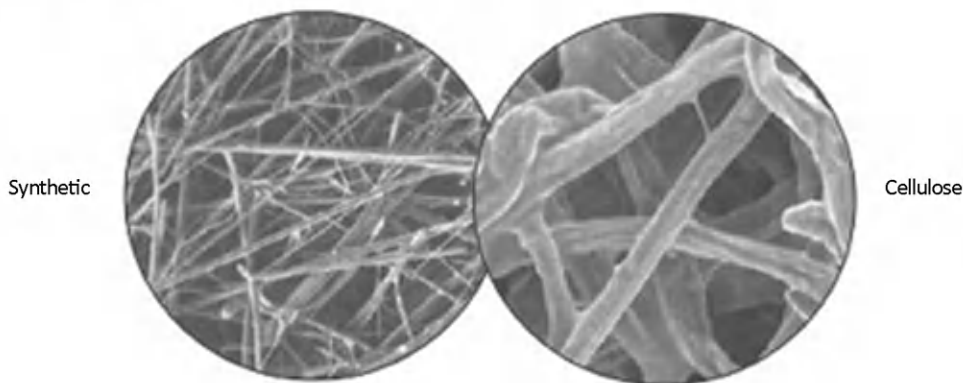

FILTRATION MEDIA

Sakura Filters use only the highest grades of media in their filters, so you can trust that the filter you use for your machine will do the best job possible in removing dirt and other contaminants from the system.

Our fuel filters are also compatible with E10 and E85 fuels, which makes them an excellent choice for our ever-growing ethanol market.

CELLULOSE VS SYNTHETIC MEDIA

Cellulose media consists of large fibres when compared to that of synthetic media. Using synthetic media provides greater area for fluid flow. It also has a greater resistance to water, and lower restriction than cellulose media of the same efficiency rating.

Natural fibre cellulose media has larger and rougher fibres that provide effective filtration for a variety of petroleum-based fluids.

As seen from the photo above, synthetic media has much smoother fibres that are also finer than their cellulose counterparts. This can make synthetic media superior to cellulose in many applications. Synthetic fibres offer the filter designer more pore spaces per surface area unit. This in turn provides more channels to trap contaminants and also allow fluid to pass through more efficiently.

Other benefits of synthetic media include:

- They are more chemically stable than cellulose in most fluids
- Synthetic media has an indefinite shelf life
- Can be used at greater operating temperatures

Technical Information

WHAT IS A BYPASS VALVE?

A bypass valve is a safety implement used in oil filters. Under ideal conditions, the bypass valve should remain closed.

When oil pressure reaches a certain level, the valve opens and allows unfiltered oil to quickly flow back into the engine. This is to prevent oil starvation of the engine.

Higher oil pressures can be caused by:

Cold starts when oil is thicker

Using incorrect oil for the engine

Constantly subjecting the engine to severe loads

Faulty oil pressure relief valve within the engine

Once oil pressure drops to below that of the bypass valve setting, the valve closes and the filtration of the engine oil can then resume.

WHAT IS AN ANTI DRAIN-BACK VALVE?

The anti drain-back valve is used to prevent oil from draining out of the filter when the engine is off.

Without the use of an anti-drainback valve, the oil must flow through and refill the filter before the correct oil pressure is reached. Keeping the filter filled with oil allows for the operating pressure to be attained much faster and minimise the risk of engine damage due to oil starvation at start-up.

Technical Information

MICRON & BETA RATINGS

Micron ratings express the size of particle that the filter media is able to remove from the fluid (fuel, oil, etc).

One micron is equal to one millionth of a metre.

Micron efficiency ratings are expressed as a percentage of the contaminants (particles) of a particular size that are removed by the filter media.

For example, 30 microns at 90% efficiency means that 90% of particles with diameter of 30 microns were removed. The lower the micron rating, the finer the particle size will be removed.

But be careful! By using a filter with the lowest micron rating in order to get the best results for your vehicle, you could potentially restrict the flow of fluid. This could cause blockages and/or provide insufficient flow to vital engine components.

Micron ratings are measured by introducing a given number of particles of known sizes into the fluid flow before the filter and then observe how much of each size was removed from the same fluid after it has flowed through the filter.

Also, if a vehicle is known to have a large amount of contaminant in its fluids, it is particularly precarious to use a filter with the lowest possible micron rating. It will be wiser to gradually reduce the micron rating permissible for the application with a filter of a slightly higher micron rating and then stepping down to a finer micron rating so the filtration process is carried out gradually.

The number of particles of the same micron size still present after completing the filtration process is known as the **Beta Rating**. If we have 100 particles of the same size pass through a filter and only 10 particles remain within the fluid, the beta rating of the filter is 10.

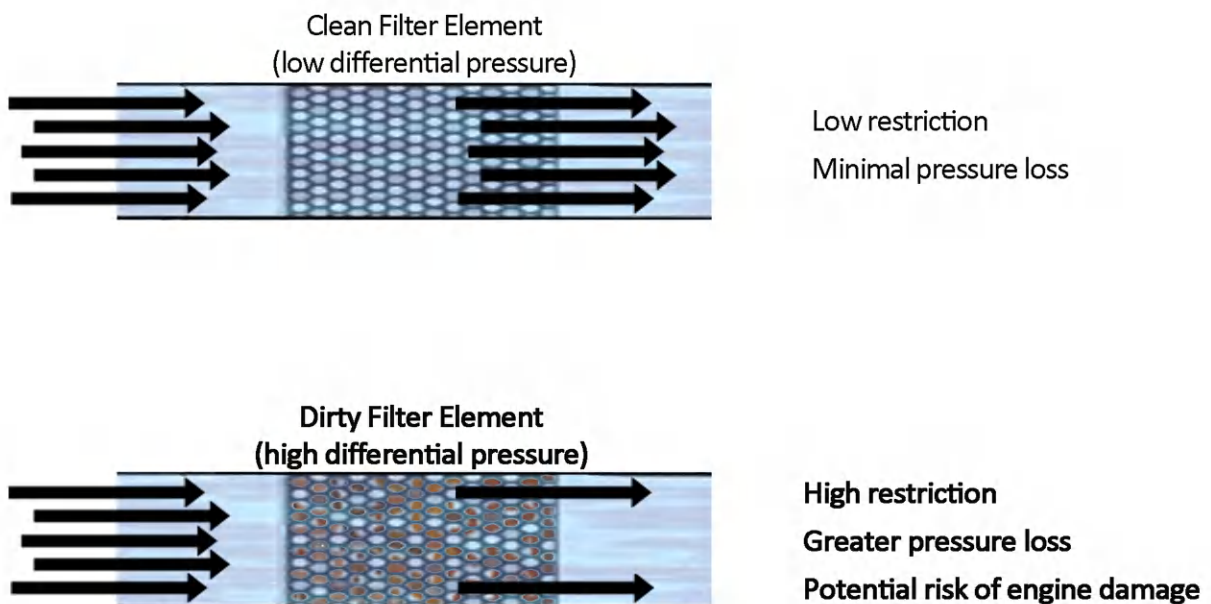

Technical Information

WHAT IS DIFFERENTIAL PRESSURE?

Differential pressure is the pressure difference between upstream and downstream flow of a given medium (oil, fuel, water, air, etc) through a restriction agent (such as a filter).

Referred to as ΔP , differential pressure is measured in PSI, KPa or Kg/cm².

The diagrams below illustrate how differential pressure can be affected based on the condition of a filtration element.

Lower differential pressure indicates less restriction, so as to allow the medium to flow unencumbered throughout the engine. However, as a filter performs its task of removing contaminants, flow gradually becomes more restricted. This restriction in flow is known as high differential pressure.

If an engine is continually operated with plugged filters, irreversible damage can occur due to air/fluid starvation and/or debris contamination.

GIVE THE CUSTOMER A BETTER CHOICE

WORLD CLASS QUALITY FILTERS

SAKURA FILTERS AUSTRALIA

Sakura Filters Australia is one of the market leaders in the import, distribution and export of automotive filters. We distribute an extensive range of fully warranted filters Australia-wide and to the Pacific Islands. Sakura Filters Australia has attained the Australian Standards AS/NZ ISO9001

PRODUCT RANGE

The range includes filters for automotive, light commercial, heavy industrial, marine, farming and mining machinery. Sakura's products have been developed throughout the years with an emphasis on the Australian market. The result is that Sakura Filters Australia have an extensive range, which covers most of the local market's needs.

QUALITY

Sakura Filters Australia's first class quality filters ensure the customer will have the best choice of products that are guaranteed free of defect. The warranty covers replacement if the product is found to be defective, and the restoration of the engine to its condition before failure in the event of engine failure due to the filter.

THE SUPPLIER

Sakura Filters Australia's main supplier since 1991 is PT Selamat Sempurna (PT SS). PT SS (part of the ADR Group of Companies) is the largest oil, air and fuel filter manufacturer in the Asia Pacific region. Continuing improvement of PT SS product quality, combined with close attention to customer needs, has won an outstanding reputation as a reliable supplier to Chevrolet, Daihatsu, Daimler Chrysler, Ford, Hino, Hitachi, Holden, Honda, Hyundai, Isuzu, Kobelco, Komatsu, Kubota, Mazda, Mitsubishi, Nissan, Nissan Diesel, Suzuki, Toyota, Yanmar, etc. Having established a firm relationship with prominent Japanese, American and Korean companies, ADR now sells products in over 100 countries worldwide. Sakura Filters Australia has a strong link with the ADR Group of Companies.

COMMITMENT

To satisfy our customers' needs, Sakura Filters Australia is committed to provide a wide range of quality products with proven warranty and first class service.
